

TKO[®] Impact-Resistant Dock Doors

Damaged dock doors are a common problem for most busy loading docks and drain valuable resources that affect your bottom line.

TKO pioneered the impact-resistant door to address lost productivity and maintenance costs associated with damage to conventional overhead and sectional doors. Since 1994, companies have installed thousands of TKO doors to reduce damage, maintain production and provide a safer working condition at the loading dock.

TKO offers the broadest line of impactable dock doors in the industry. High wind load conditions, temperature controlled environments or just plain abuse – there is a TKO door suited to your dock. All TKO doors are designed to be impacted, providing years of use without the costly panel and track damage associated with conventional overhead and sectional doors.

LoadHog[®] Dockbridge

For years, warehousing operations have been asking for a better solution for their loading dock needs than edge-of-dock levelers, portable plates and many types of mechanical pit-styled dock levelers can provide.

The LoadHog is a modular dock bridge designed to span the gap between the warehouse and the trailer. It mounts to the warehouse floor using only four heavy-duty anchor bolts and requires no concrete work. The bumper block assembly attaches to the face of the dock with four anchors per bumper.

- Easy installation – no concrete pit required
- Superior sanitary and rodent control
- 5', 6' and 7' widths available
- Working range 8" above and below dock
